Table 1. Country-year characteristics by conflict exposure in the previous year

Course panel of 186 countries, 2000-2019. All eligible country-years are retained before outcome-specific model exclusions.

Values are median [25th, 75th percentile] for continuous variables, except calendar years (range), and n (column %) for categorical variables. Summaries use observed values; categorical percentages use the non-missing group denominator. Missing n is shown for every variable, including zero. A dash means not applicable or reported once in the Region header. OECD = Organisation for Economic Co-operation and Development. Each binary row reports the yes category. Conflict exposure has no missing values.

N counts country-years, not independent countries. Each country has 20 years overall; exposure can change over time. There are 173 countries in the no-prior-conflict stratum and 88 in the prior-conflict stratum; 75 contribute to both. Summaries are unweighted. No significance tests are used.

Prior conflict means at least one conflict with at least 25 deaths in that country during the preceding calendar year. Earthquake and drought refer to the outcome year. All 372 maternal values for 2018-2019 are missing; there are 54 additional missing maternal values in 2000-2017. No imputation or blanket complete-case exclusion was applied. Covariate scales are retained as supplied; the extract does not provide a complete unit codebook.
